

Coriolis Quality Control System

Christine Coatanoan, Thierry Carval
& Coriolis Team

Christine.Coatanoan@ifremer.fr

OBSERVING SYSTEM

Coriolis coordinates the French contribution to the Argo international array by deploying between 60 and 80 floats per year. It systematically acquires observations from most of the French research vessels or from several voluntary merchant vessels. It maintains several moorings of the Pirata tropical Atlantic network and deploys between 10 to 20 surface drifters per year.

MOORED BUOYS

Anchored at a fixed location, they provide full depth time series of a wide variety of variables.

RESEARCH OR VOLUNTARY MERCHANT

vessels acquire surface data during transit

SCIENTIFIC CRUISES

provide accurate full depth physical and biogeochemical measurements

SURFACE DRIFTERS

While drifting at the surface they measure sea surface temperature, sea surface salinity, air pressure and surface currents.

ARGO PROFILING FLOATS

Mainly real-time temperature and salinity profiles from surface down to 2000 m every 10 days

DATA CENTRES

Acquire the data in real-time by satellite transmission, process and distribute them to users

TIDE GAUGES

Provide sea level reference measurements

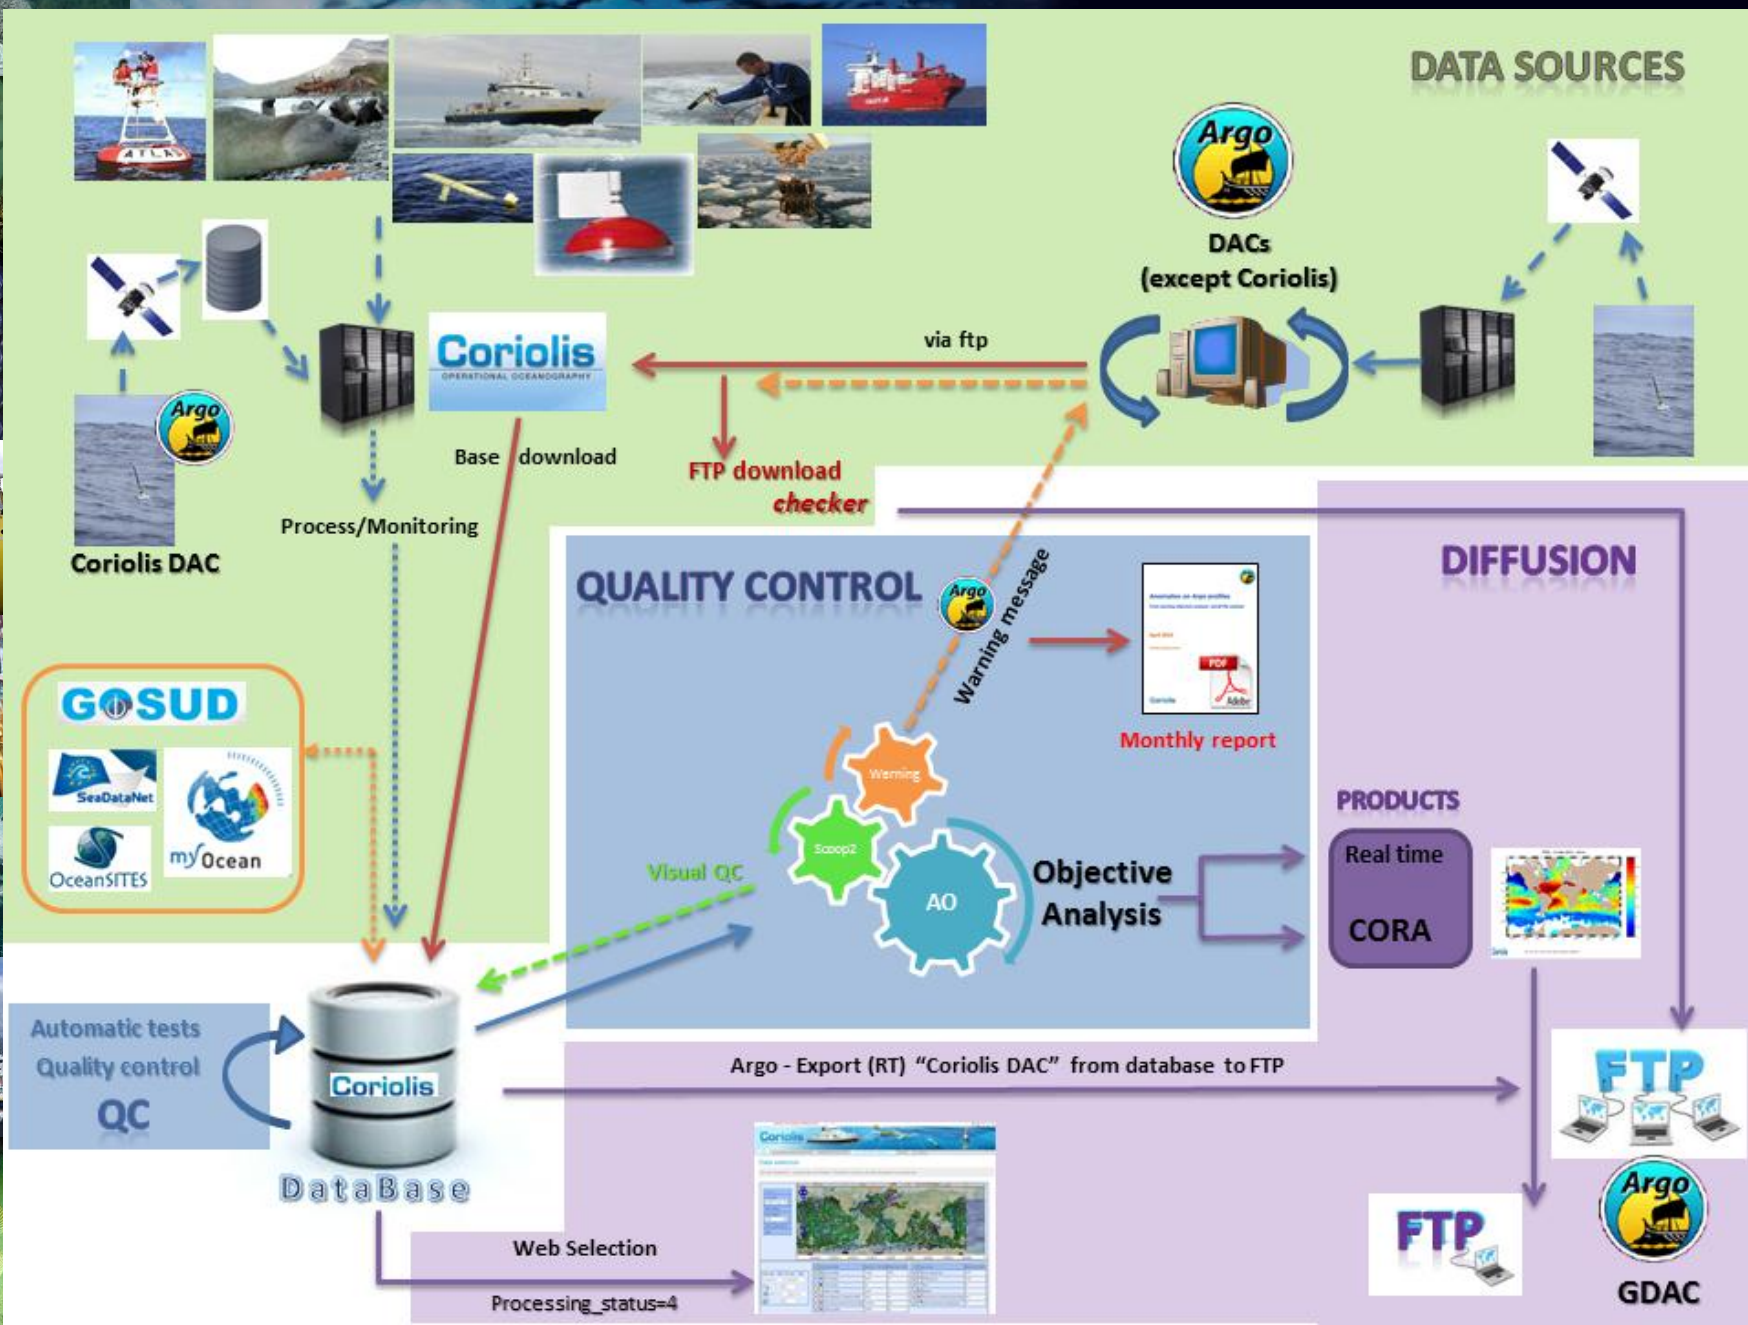

GLIDERS

while gliding from surface to about 1000m they provide real-time physical and biogeochemical data along their transit

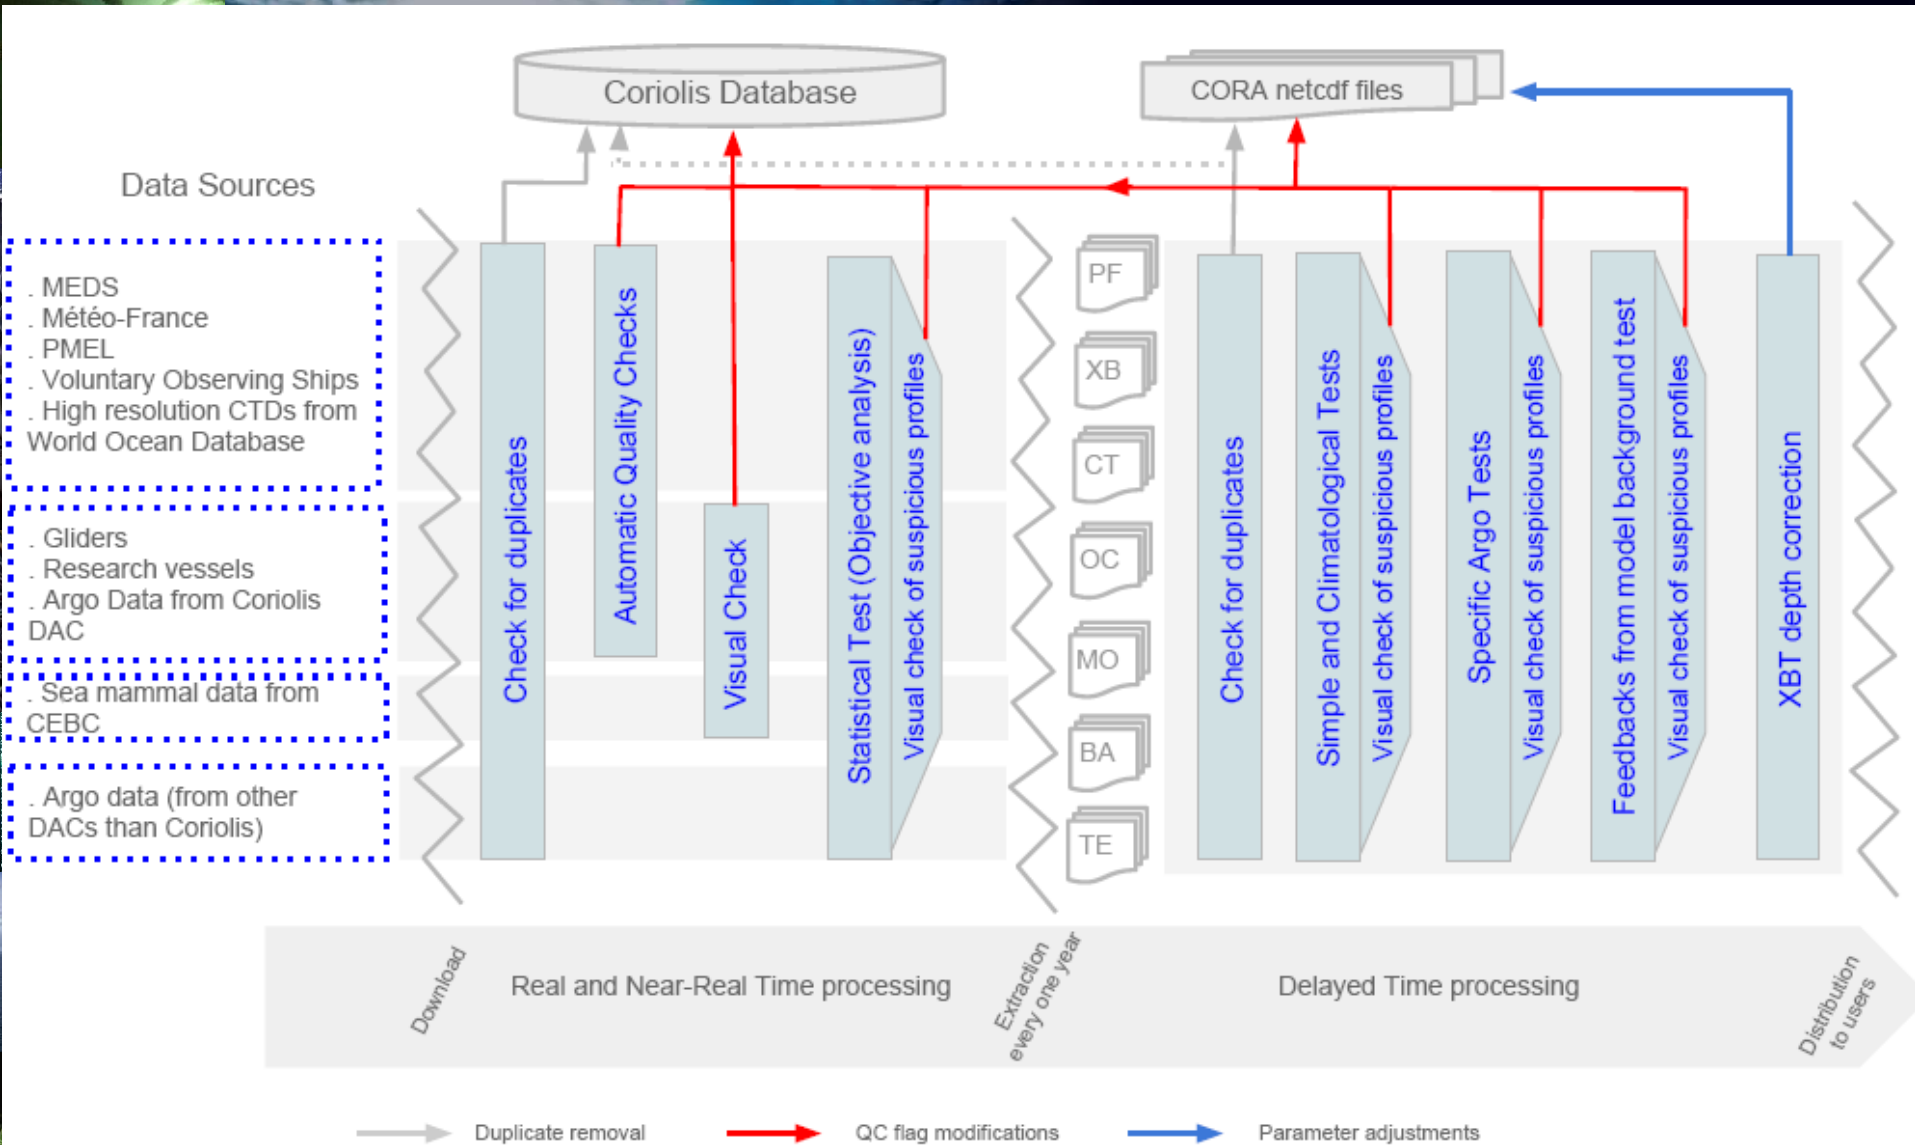

SEA MAMMALS

provide real time temperature and salinity in polar areas

Data flow in Coriolis database & Quality Control

From Real time to Delayed Mode

Quality control in Coriolis data

Real Time - Automatic tests (based on the ARGO project)

- test 1: Platform Identification
- test 2: Impossible Date Test
- test 3: Impossible Location Test
- test 4: Position on Land Test
- test 5: Impossible Speed Test
- test 6: Global Range Test
- test 7: Regional Global Parameter Test for Red Sea and Mediterranean Sea
- test 8: Pressure Increasing Test
- test 9: Spike Test
- test 10: Top and Bottom Spike Test
- test 11: Gradient Test
- test 12: Digit Rollover Test
- test 13: Stuck Value Test
- test 14: Density Inversion
- test 15: Grey List
- test 16: Gross salinity or temperature sensor drift

CODE	SIGNIFICATION
0	NOT CONTROLLED VALUE
1	CORRECT VALUE
2	VALUE INCONSISTENT WITH STATISTICS
3	DOUBTFUL VALUE (Gradient,...)
4	FALSE VALUE (Out of scale, constant profile, vertical instability)
5	VALUE MODIFIED DURING QC (interpolation location or date)
6-8	Not USED
9	MISSING VALUE

Visual control: for some data types

Global controls: residuals from objective analysis detect anomalies (& visual control)

Objective Analysis ISAS

(F.Gaillard, LPO, Ifremer)

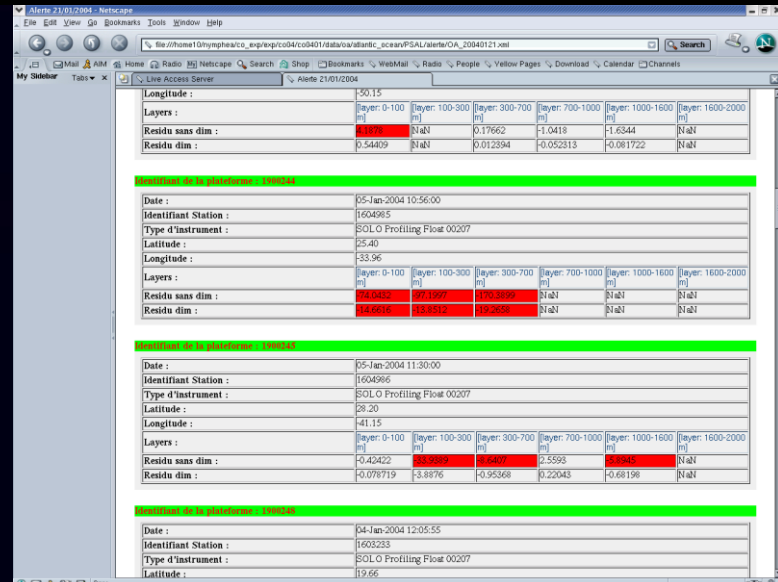

The operational analysis system set up by the IN SITU TAC Global component operated by CORIOLIS data center. It produces temperature and salinity gridded fields. The system is based on an statistical estimation method (objective analysis). This system allows presenting a synthesis and a validation of the dataset, providing a support for localized experience (cruises), providing a validation source for operational models, observing seasonal cycle and inter-annual variability. It is the In Situ Objective analysis operational nominal product for the Global Ocean. The dataset contains data from different types of instruments: mainly Argo floats, XBT, CTD and XCTD, and Mooring. The data are stored in 7 files types: PF, XB, CT, OC, MO, BA, TE.

This system is operated by the IN SITU TAC on different time scales :

- REAL-TIME OBJECTIVE ANALYSIS
- NEAR-REAL TIME OBJECTIVE ANALYSIS
- DELAYED MODE OBJECTIVE ANALYSIS

A vertical collage of four images. The top image shows a rocky coastline with a lighthouse. The second image shows a green landscape with a river. The third image shows a close-up of blue and white patterned fabric. The bottom image shows a yellow boat on a barge.

If one of those residuals is higher than defined “red” threshold (4 for residuals means on 6 depth layers and 8 for residuals at each level), the profile is in warning to be check by an operator.

OBJECTIVE ANALYSIS ALERT/ANOMALIES

Daily : RT Objective analysis (version 6.2)

Detection on anomalies => alert in the database in the historical field of the stations (QCTEST)

Station with alert => (RTQCGL01) to be controlled visually

When QC is changed in our database, information sent to the DAC

2014 : QCTEST IN (1,2,3,4,5,6) – OA version < 6.2

End of 2014 – April 2015 : QCTEST IN (1,2,3,4)

Since May 2015 : QCTEST IN (1,2,3,4,5)

Alert definition

- ☐ 1: standardization (test to the standard deviation failed)
- ☐ 2: analysis failed - inexistent
- ☐ 3: red analysis (residuals / threshold)
- ☐ 4: undefined analysis
- ☐ 5: spike/offset climatology
- ☐ 6: white analysis - no visual control, for the delayed mode study

Visual control : SCOOP

Using objective analysis for QC in delayed mode : CORA

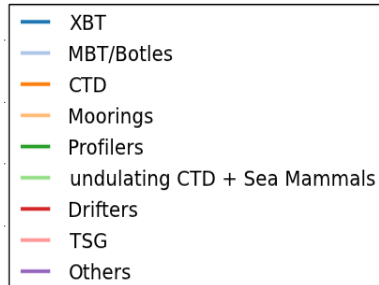

CORA 4.2 – COriolis dataset for ReAnalysis

Temperature and Salinity dataset

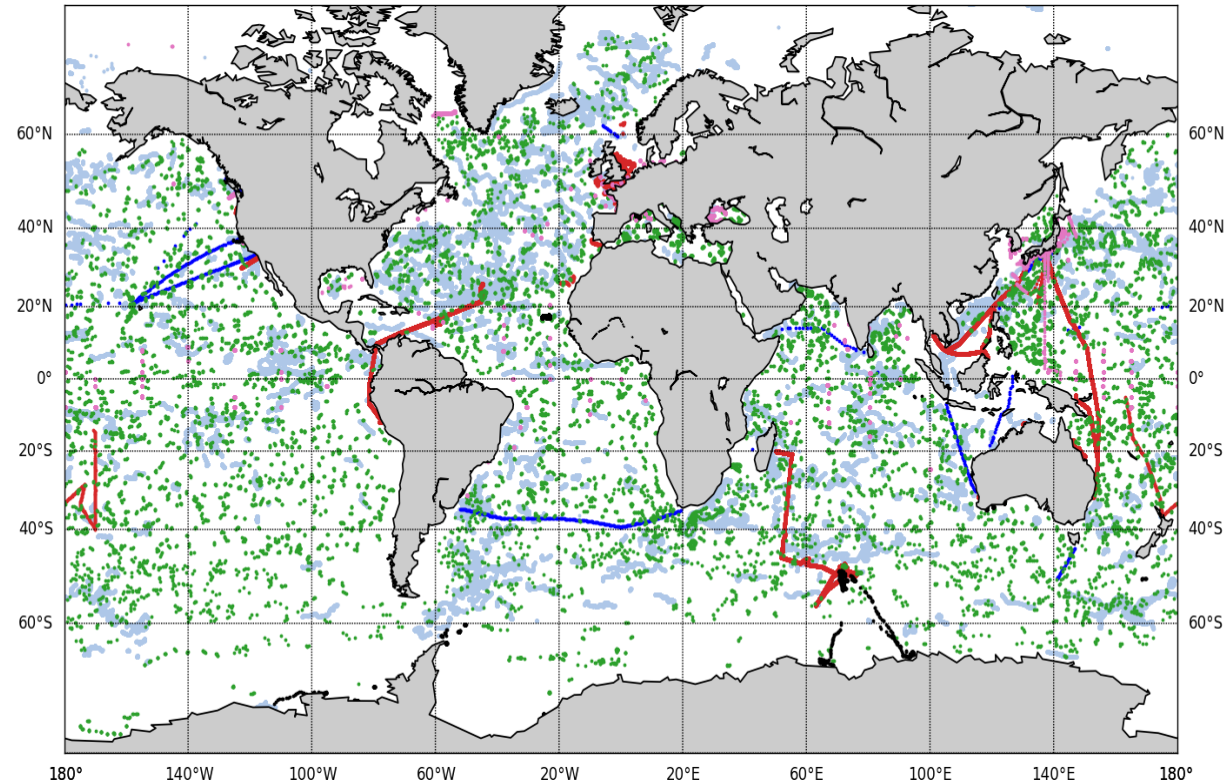

1950-2014 Global ocean

Delayed mode validated profiles

Numerous instrument types:

And also 2500000 profiles from SHOM

From Tanguy Szekely (Coriolis R&D)

CORA4.2 dataset description

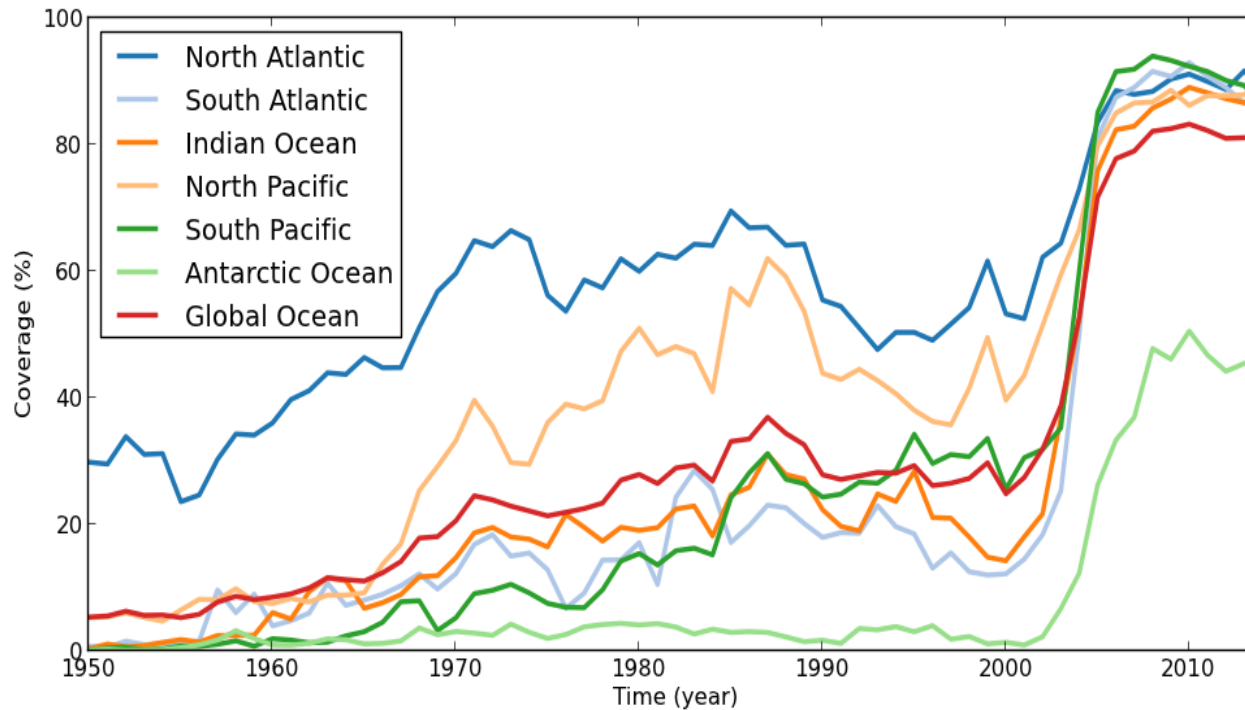

Instrument types:

Updates from CORA 4.1 : Over 4 million new delayed time validated profiles.

CORA4.2 dataset description

Ocean basin sampling rates

CORA4.2 dataset uncertainties

Table 1. Accuracies of the different data types included in CORA3. The type of netcdf files where each data type can be found is also listed (in *italic* for the most frequent occurrences). Note that data received from the GTS are not full resolution: data are truncated two places after the decimal point for the TESAC (TE) type and one place after the decimal point for the BATHY (BA) type.

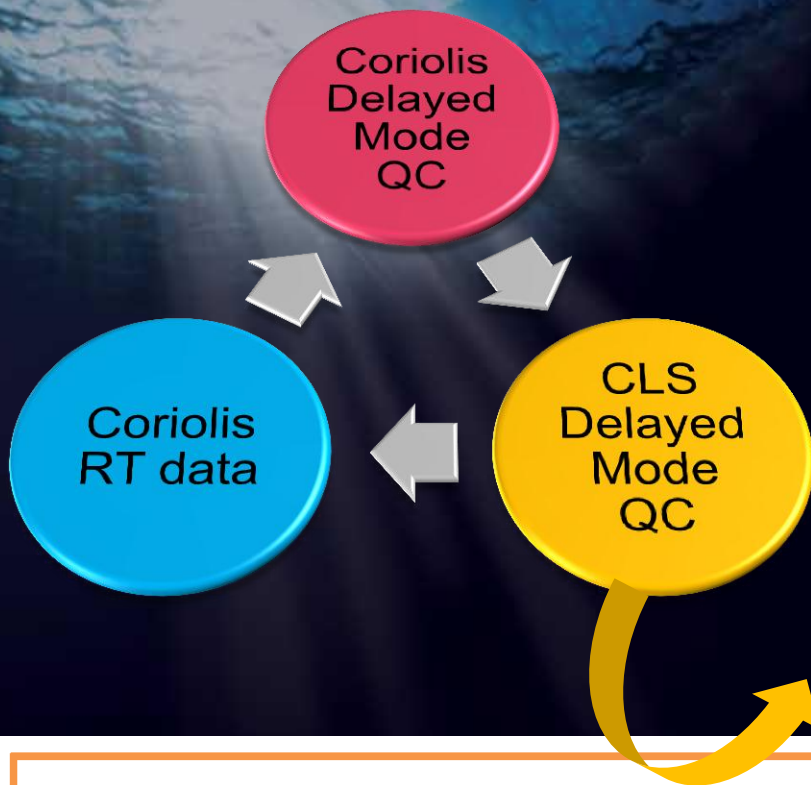

“Probe types” (and the associated codes)	Type of files	Temperature accuracy	Salinity accuracy	Pressure or depth accuracy
XBT (10)	<i>XB</i> , BA, TE	0.03–0.01 °C ^a		2 % ^a
CTD (20)	<i>OC</i> , TE, BA, CT	0.001 °C –0.005 °C ^a	0.02–0.003 ^a	0.015–0.08 % ^a
XCTD (30)	<i>BA</i> , <i>TE</i> , <i>OC</i> , <i>XB</i> , CT	0.02 °C ^a	0.05–0.08 ^b	2 % ^a
Argo Floats (40)	<i>PF</i> , TE	0.01 °C ^c	0.01 ^c	2.4 db ^c
TAO/TRITON, PIRATA, RAMA (51)	<i>TE</i> , MO, BA	Standard ATLAS: 0.003–0.03 °C (SST) 0.003–0.09 °C (subsurface) Next Gen. ATLAS 0.003–0.02 °C ^d	0.02 ^d	1 db ^d
Gliders (60)	<i>CT</i> , TE	0.001 °C –0.005 °C ^a	0.02–0.003 ^a	
Sea mammals (70)	<i>TE</i> , CT	0.01 °C ^e	0.02 ^e	
Drifting buoys (80)	<i>TE</i> , BA	0.002–0.01 °C ^a	0.003–0.01 ^a	
Coastal (52) and other moorings (50)	<i>TE</i> , BA	Nominal 1 °C (Achieved 0.08 °C) ^f	0.001 µS cm ^{–1} ^f

Le Traon, 2013: The CORA dataset: validation and diagnostics of in-situ ocean temperature and salinity measurements. *Ocean Science*, 9, 1-18, <http://www.ocean-sci.net/9/1/2013/os-9-1-2013.html>, doi:10.5194/os-9-1-2013

CORA 4.2 – Delayed Mode Validation

CLS altimetry test

- Focus on Costal profiles
- Altimetry based bias detection
- 11000 profiles flagged after a visual check

Test	Corrected profiles
Test on land	33
Vertical inversion	161
Non monotonous PRES	969
T/S=0 at P=0	58
Regional boundaries	265
Constant T/S	91
Climatology comparison	3310
Spikes detection	68
Bias detection	6023
Total	10979

Minmax test description

Reference field of the minimum and maximum observed temperature in 120km wide hexagonal cells

- Based on ARGO, CTD and sea mammals profiles.
- Very efficient to find biased profiles
- Lower wrong detection rate
- Accurate in the deep ocean

PSAL profile, January 2014, South Atlantic

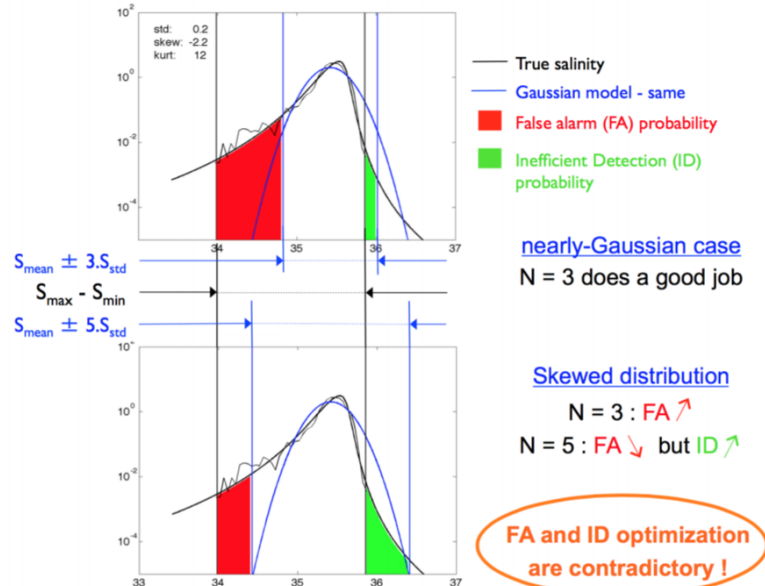

Jérôme Gourrion et al, poster session OD14C-2440:

Improved Statistical Method for Hydrographic Climatic Record Quality Control

Minmax test description

Impact of nearly-Gaussian assumption : a skewed salinity distribution

typical of fresh water input or advection area

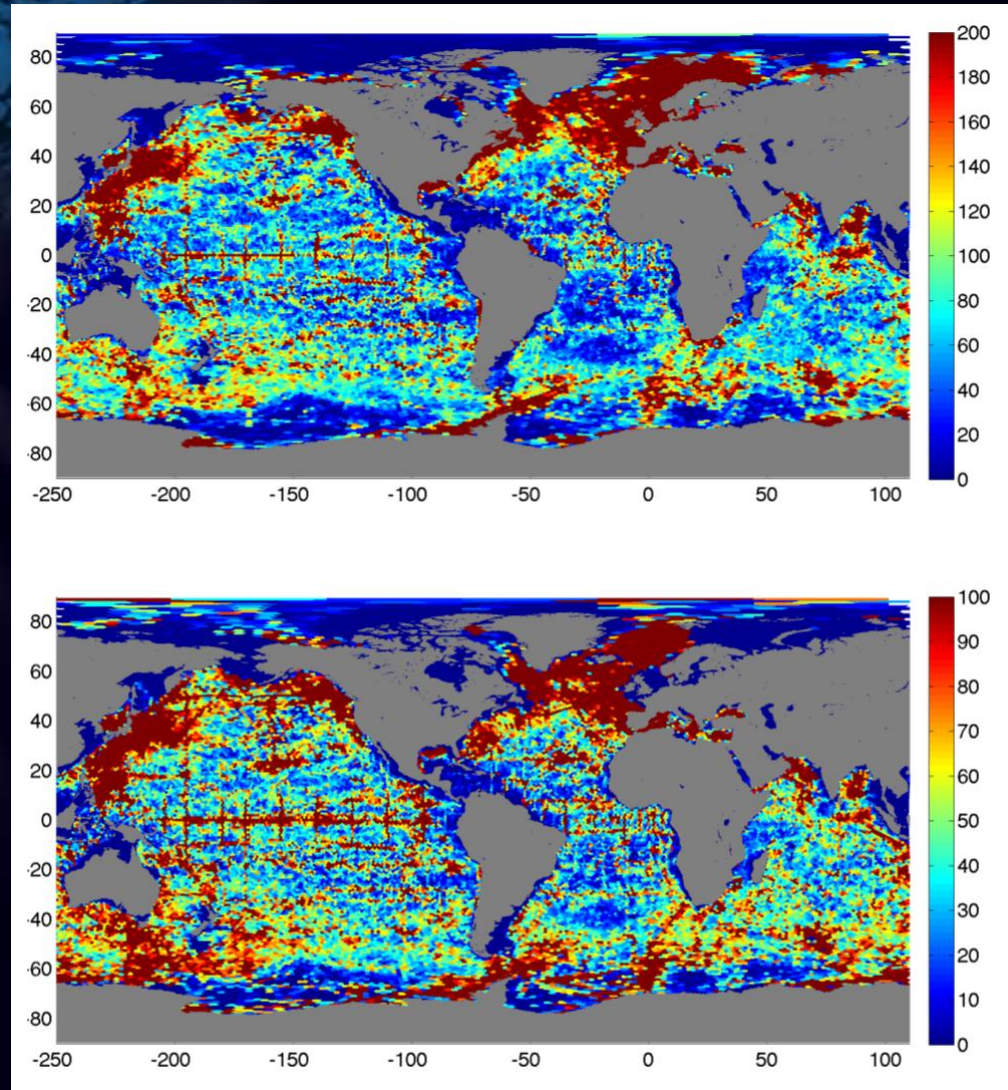

Main assumptions on data distribution currently implemented :

Unimodal

Symmetric

Homogeneously non-gaussian

Ifremer

Number of samples per grid cell.

Top: the 0-10 db layer. Bottom: 500-510 db layer.

Minmax test description

Upper panels: minimum salinity value. Bottom: maximum salinity value.
Left (right) column corresponds to the 0-10 db (500-510 db) layer.
